Week 3 Lecture 2 Notes

How to create a hello world program:

```
Class MyClass { //1
public static void main(string[] args) { //2
system.out.println("Hello World"); //3
};
};
```

1: Class declaration. Java is an object-oriented programming language, and thus requires the use of classes or objects. Declare a class with "class" and a name "MyClass"

2: Entry point. The entry point, dictated by the main() method, is where the compiler starts to run the program.

3: Code. This code snippet will print "Hello World" to the console.

After you have written your program, right click and run it. You should see "Hello World" in the terminal.
